

the data currently posted on the web is buried in HTML files suitable for human reading and not for computers to manipulate meaningfully. The semantic Web, an extension of the current web, can be thought of as a globally linked database where information is given well-defined meaning using metadata for better enabling computers and humans to work in close co-operation. The realisation of a Semantic Web will thus make machine reasoning more ubiquitous and devastatingly powerful, creating an environment where intelligent software agents can roam, carrying out sophisticated tasks for their users.

This course is about investigating the next generation of the Web whose key distinguishing characteristics will be the support for and use of semantics in new, more effective, more intelligent, ways of managing information and supporting applications.

**Detailed Syllabus** Topics to be covered include:

- Introduction to the Semantic Web
- Introduction to Ontologies
- Ontology Languages for the Semantic Web
  - Resource Description Framework (RDF)
  - Lightweight ontologies: RDF Schema
  - Web Ontology Language (OWL)
  - A query language for RDF: SPARQL
- Ontology Engineering
- Semantic web and Web 2.0
- Applications of Semantic Web
