Motivation

Verifying two-place buffer

?

Weak Equivalences

Idea

- ▶ **Internal** actions should be **invisible** to the outside world

Weak Equivalences

Idea

- ▶ **Internal** actions should be **invisible** to the outside world
- ▶ τ : The collective name for **all invisible actions**

Weak Equivalences

Idea

- ▶ **Internal** actions should be **invisible** to the outside world
- ▶ τ : The collective name for **all invisible actions**
- ▶ Adapt behavioral equivalence to **neglect τ**

Trace Equivalence

Traces of a State

For state $t \in S$, $Traces(t)$ is the minimal set satisfying:

1. $\epsilon \in Traces(t)$
2. $\checkmark \in Traces(t)$ when $t \in T$
3. $a\sigma \in Traces(t)$ when $t \xrightarrow{a} t'$, and $\sigma \in Traces(t')$

Trace Equivalence

For states t, t' , t is trace equivalent to t' iff $Traces(t) = Traces(t')$.

Weak Trace Equivalence

Weak Traces of a State

For state $t \in S$, $WTraces(t)$ is the minimal set satisfying:

1. $\epsilon \in WTraces(t)$
2. $\checkmark \in WTraces(t)$ when $t \in T$
3. $a\sigma \in WTraces(t)$ when $t \xrightarrow{a} t'$, ($a \neq \tau$) and $\sigma \in WTraces(t')$
4. $\sigma \in WTraces(t)$ when $t \xrightarrow{\tau} t'$ and $\sigma \in WTraces(t')$

Weak Trace Equivalence

For states t, t' , t is trace equivalent to t' iff

$$WTraces(t) = WTraces(t') \text{ and } Traces(t) = Traces(t').$$

Weak Traces

Example

Weak Traces

Example

1. $\epsilon \in WTraces(t)$,
2. $\checkmark \in WTraces(t)$ when $t \in T$,
3. $a\sigma \in WTraces(t)$ when $t \xrightarrow{a} t'$ and $\sigma \in WTraces(t')$,
4. $\sigma \in WTraces(t)$ when $t \xrightarrow{\tau} t'$ and $\sigma \in WTraces(t')$.

What are $WTraces(s_0)$ and $WTraces(t_0)$?

Weak Traces

Example

1. $\epsilon \in WTraces(t)$,
2. $\checkmark \in WTraces(t)$ when $t \in T$,
3. $a\sigma \in WTraces(t)$ when $t \xrightarrow{a} t'$ and $\sigma \in WTraces(t')$,
4. $\sigma \in WTraces(t)$ when $t \xrightarrow{\tau} t'$ and $\sigma \in WTraces(t')$.

What are $WTraces(s_0)$ and $WTraces(t_0)$?

- ▶ $WTraces(t_4) = WTraces(t_5) = \{\epsilon, \checkmark\}$,

Weak Traces

Example

1. $\epsilon \in WTraces(t)$,
2. $\checkmark \in WTraces(t)$ when $t \in T$,
3. $a\sigma \in WTraces(t)$ when $t \xrightarrow{a} t'$ and $\sigma \in WTraces(t')$,
4. $\sigma \in WTraces(t)$ when $t \xrightarrow{\tau} t'$ and $\sigma \in WTraces(t')$.

What are $WTraces(s_0)$ and $WTraces(t_0)$?

- ▶ $WTraces(t_4) = WTraces(t_5) = \{\epsilon, \checkmark\}$,
- ▶ $WTraces(t_2) = \{\epsilon, coffee, coffee\checkmark\}$, $WTraces(t_3) = \{\epsilon, tea, tea\checkmark\}$,

Weak Traces

Example

1. $\epsilon \in WTraces(t)$,
2. $\checkmark \in WTraces(t)$ when $t \in T$,
3. $a\sigma \in WTraces(t)$ when $t \xrightarrow{a} t'$ and $\sigma \in WTraces(t')$,
4. $\sigma \in WTraces(t)$ when $t \xrightarrow{\tau} t'$ and $\sigma \in WTraces(t')$.

What are $WTraces(s_0)$ and $WTraces(t_0)$?

- ▶ $WTraces(t_4) = WTraces(t_5) = \{\epsilon, \checkmark\}$,
- ▶ $WTraces(t_2) = \{\epsilon, coffee, coffee\checkmark\}$, $WTraces(t_3) = \{\epsilon, tea, tea\checkmark\}$,
- ▶ $WTraces(t_1) = \{\epsilon, coffee, tea, coffee\checkmark, tea\checkmark\}$,

Weak Traces

Example

1. $\epsilon \in WTraces(t)$,
2. $\checkmark \in WTraces(t)$ when $t \in T$,
3. $a\sigma \in WTraces(t)$ when $t \xrightarrow{a} t'$ and $\sigma \in WTraces(t')$,
4. $\sigma \in WTraces(t)$ when $t \xrightarrow{\tau} t'$ and $\sigma \in WTraces(t')$.

What are $WTraces(s_0)$ and $WTraces(t_0)$?

- ▶ $WTraces(t_1) = \{\epsilon, coffee, tea, coffee\checkmark, tea\checkmark\}$,
- ▶ $WTraces(t_0) = \{\epsilon, coin, coin\ coffee, coin\ tea, coin\ coffee\checkmark, coin\ tea\checkmark\}$.

Weak Trace Equivalence

Observation

$WTraces(s_0) = WTraces(t_0) = \{ \epsilon, coin, coin\ coffee, coin\ tea, coin\ coffee\checkmark, coin\ tea\checkmark \}$

Moral of the Story: Weak Trace equivalence is **too coarse**

Weak Bisimulations

Idea

1. Mimic a -transition by same transition possibly with (stuttering) τ -transitions before and/or after
2. τ -transition can be mimicked by remaining in same state (making no transition)

Weak Bisimulation

Strong Bisimulation

$R \subseteq S \times S$ is **strong bisimulation** iff
for $s, t \in S$ s.t. $s R t$, and $a \in Act$:

▶ if $s \xrightarrow{a} s'$ then

▶ $\exists t' \in S$ s.t. $t \xrightarrow{a} t'$ and $s' R t'$,

▶ if $s \in T$ then $t \in T$.

and vice versa.

Weak Bisimulation

Weak Bisimulation

$R \subseteq S \times S$ is **weak bisimulation** iff
for $s, t \in S$ s.t. $s R t$, and $a \in Act$:

- ▶ if $s \xrightarrow{a} s'$ then
 - ▶ $a = \tau$ and $s' R t$, or
 - ▶ $\exists t'_1, t'_2, t' \in S$ s.t. $t \xrightarrow{\tau}^* t'_1 \xrightarrow{a} t'_2 \xrightarrow{\tau}^* t'$ and $s' R t'$,
- ▶ if $s \in T$ then $\exists t' \in S$ $t \xrightarrow{\tau}^* t'$ and $t' \in T$.

and vice versa.

Branching Bisimulation

Strong Bisimulation

$R \subseteq S \times S$ is **strong bisimulation** iff
for $s, t \in S$ s.t. $s R t$, and $a \in Act$:

- ▶ if $s \xrightarrow{a} s'$ then
 - ▶ $\exists t' \in S$ s.t. $t \xrightarrow{a} t'$ and $s' R t'$,
- ▶ if $s \in T$ then $t \in T$.

and vice versa.

Branching Bisimulation

Branching Bisimulation

$R \subseteq S \times S$ is **branching bisimulation** iff

for $s, t \in S$ s.t. $s R t$, and $a \in Act$:

- ▶ if $s \xrightarrow{a} s'$ then
 - ▶ $a = \tau$ and $s' R t$, or
 - ▶ $\exists t'_1, t' \in S$ s.t. $t \xrightarrow{\tau} *t'_1 \xrightarrow{a} t'$, $s R t'_1$ and $s' R t'$,
- ▶ if $s \in T$ then $\exists t' \in S t \xrightarrow{\tau} *t'$ and $t' \in T$.

and vice versa.

Weak vs. Branching Bisimulation

Weak Bisimulation

Weak vs. Branching Bisimulation

Weak Bisimulation

Branching Bisimulation

Weak Bisimulations and Choice

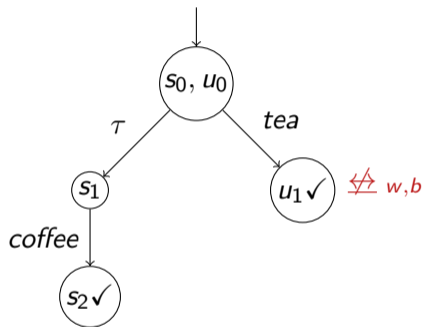

Weak Bisimulations and Choice

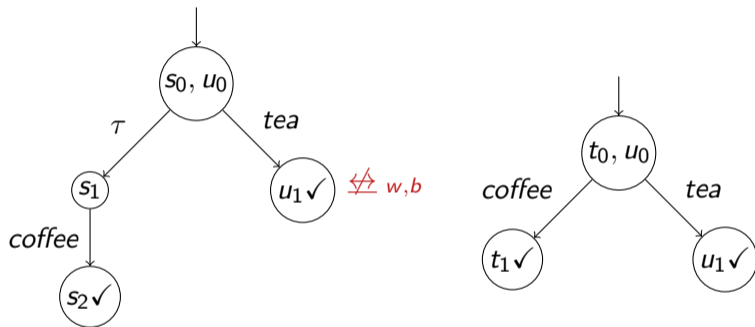

Weak Bisimulations and Choice

Weak Bisimulations and Choice

Weak Bisimulations and Choice

Observation

Weak- and branching bisimulation **are not preserved** under **choice**

Root Condition

Basic Idea

For a branching (or weak) bisimulation to be a congruence with respect to choice, the **first τ -transition** should be **mimicked** by a **τ transition**.

Rootedness

Two state s, t are **rooted** branching bisimilar if

- ▶ there exists a branching bisimulation relation R such that $s R t$ and
- ▶ if $s \xrightarrow{a} s'$ then there is $t' \in S$ s.t. $t \xrightarrow{a} t'$ and $s' \xleftrightarrow{b} t'$, and
- ▶ if $t \xrightarrow{a} t'$ then there is $s' \in S$ s.t. $s \xrightarrow{a} s'$ and $s' \xleftrightarrow{b} t'$, and
